E-Commerce Sales Analytics Dashboard using Power BI

1. Introduction

- Brief introduction about the project
- Objective of developing the dashboard

The project aims to analyze online sales data using Power BI and develop an interactive dashboard for business decision-making.

2. Dataset Description

- Name of dataset: Online Sales Data
- Type of dataset: E-commerce transactional dataset
- Fields included:
  - Transaction ID
  - Date
  - Product Category
  - Product Name
  - Units Sold
  - Unit Price
  - Total Revenue
  - Region
  - Payment Method

4. Measures and KPIs Created

List the DAX measures used:

- Total Revenue Measure
- Total Orders
- Total Units Sold
- Average Order Value
- Average Unit Price Revenue per Product

3. Data Transformation

Mention the preprocessing steps performed:

- Corrected data types
- Created:
  - Year
  - Month Name
  - Month Number
  - Quarter
  - Day Name
- Created Revenue Range column
- Sorted Month Name using Month Number

5. Visualizations Used

Mention the dashboard visuals:

- KPI Cards
- Line Chart
- Bar Chart
- Treemap
- Donut Chart

6. Key Insights

- Identified high-performing product categories
- Analyzed regional sales distribution
- Studied payment method preferences
- Evaluated sales trends over time
- Compared product performance

7. Conclusion

The Power BI dashboard successfully transformed raw sales data into meaningful visual insights and enabled interactive business analysis for better decision-making
